

LazOne HTML & CSS requirements

You can use generative AI to produce the content for your site or you can use a Lorem Ipsum generator. I've included some images in the resources for you to use.

I recommend writing the HTML first, and then doing the CSS afterwards.

The website doesn't need to look professional but I would recommend trying to use many different CSS styles.

Try to build everything on your own before referring to the code in the completed project.

Home page

- The home page should include two distinct columns, one for the main content and another with some contact information
- The main content should include two rows
- The first row should discuss the products and link to the products page
- The second row should talk about the company and link to the about us page
- Each row should include an image, a heading, written content and a button

Products

- The product page should have a page heading and some intro text
- The products should then be displayed as a list or a grid, the choice is yours
- Each product should display an image, the product name, the description, the price, and a button to add to cart

About Us

- The about us page should include a page heading
- The about us page should have three rows
- Each row should have an image, a heading, and some text

Contact Us

- The contact us page should have a heading, some text and a contact form
- The contact page should also include a list of contact details
- The form doesn't need to work, that's for a later project

Page Navigation

- The final challenge is creating a navigation bar, best practice is to store the navigation bar in its own file and to call that file on every page, but you don't have the tools to do that yet, so you'll need to copy and paste the work across every page
- The navigation bar should have the LazOne logo which links back to the home page
- You should have a link for every page
- Try to display contact information in the navigation bar
- The navigation bar should stay at the top of the page as you scroll down
- Bonus points if you include a drop down table
